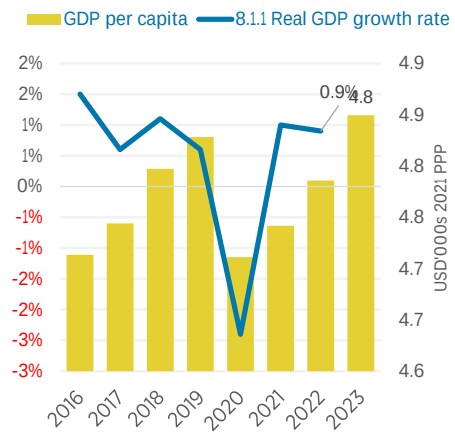
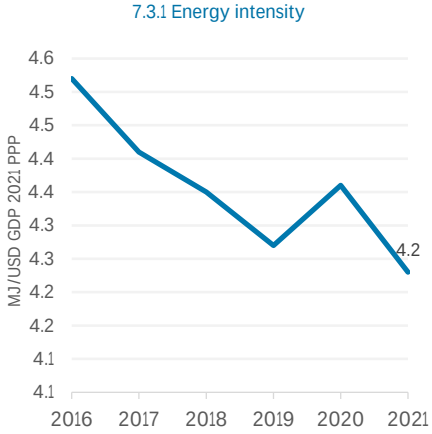
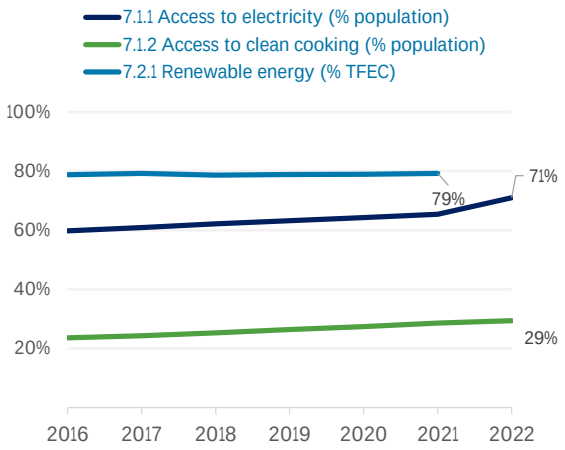
ENERGY PROFILE

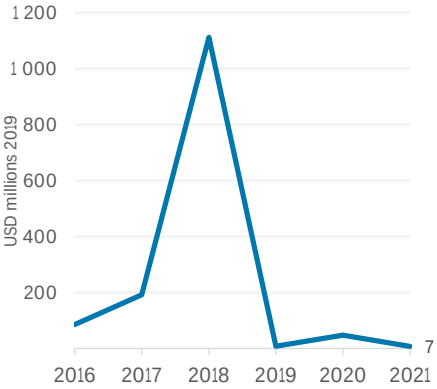
Cameroon

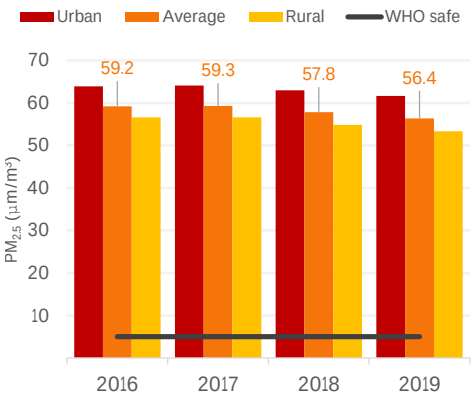
COUNTRY INDICATORS AND SDGS











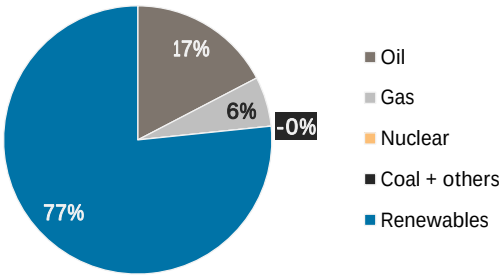
TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2016	2021
Non-renewable (TJ)	105 693	99 897
Renewable (TJ)	285 927	327 772
Total (TJ)	391 619	427 669
Renewable share (%)	73	77

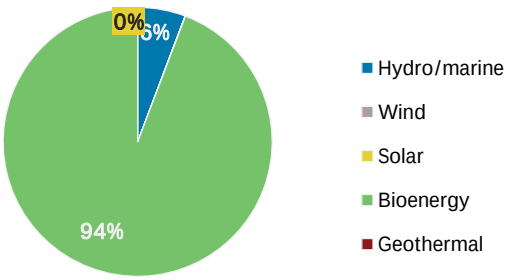
Growth in TES	2016-21	2020-21
Non-renewable (%)	-5.5	-5.0
Renewable (%)	+14.6	+3.4
Total (%)	+9.2	+1.3

Primary energy trade	2016	2021
Imports (TJ)	96 146	73 117
Exports (TJ)	205 880	204 274
Net trade (TJ)	109 734	131 157
Imports (% of supply)	25	17
Exports (% of production)	41	37
Energy self-sufficiency (%)	128	131

Total energy supply in 2021

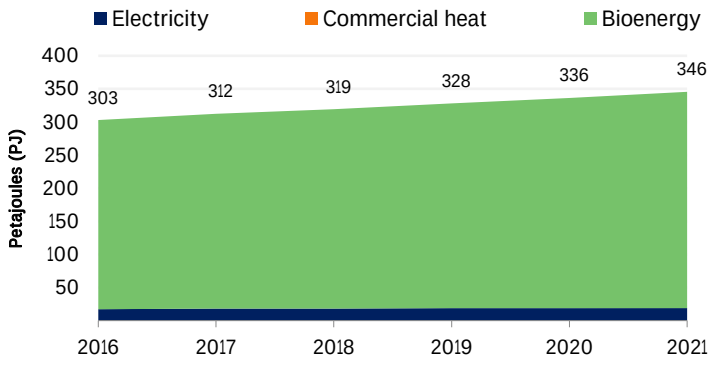


Renewable energy supply in 2021



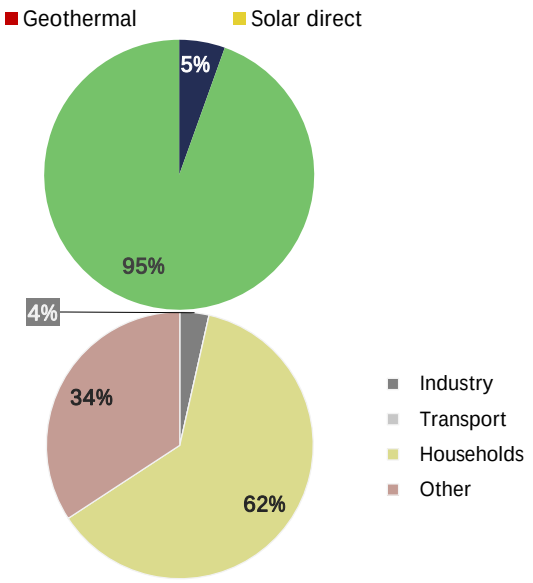
RENEWABLE ENERGY CONSUMPTION (TFEC)

Renewable TFEC trend



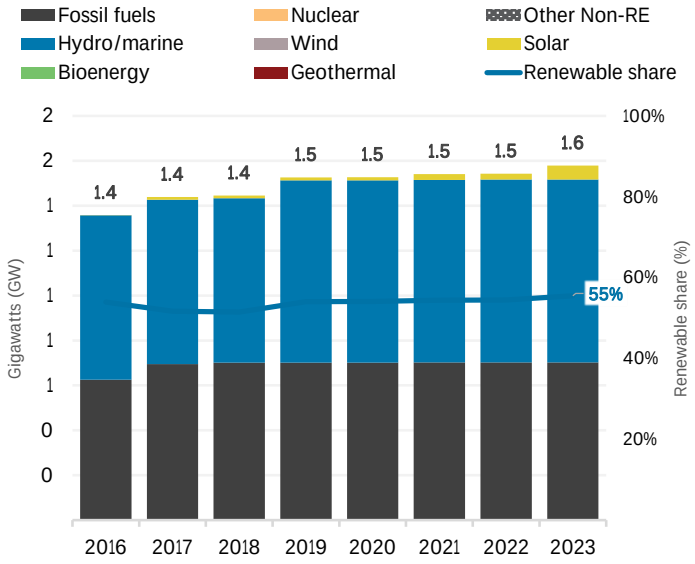
Consumption by sector	2016	2021
Industry (TJ)	11 173	12 182
Transport (TJ)	0	0
Households (TJ)	192 126	215 149
Other (TJ)	99 732	118 269

Renewable energy consumption in 2021

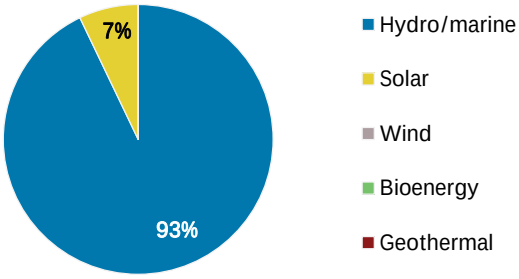


ELECTRICITY CAPACITY

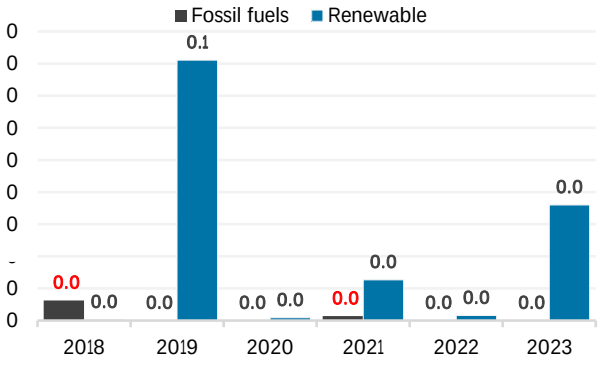
Installed capacity trend



Renewable capacity in 2023



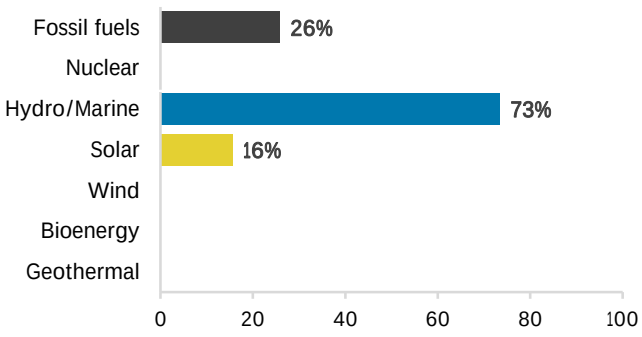
Net capacity change (GW)



Net capacity change in 2023 (MW)

Non-renewable: 0	Hydro and marine: 0
Solar: + 36	Wind: 0
Bioenergy: 0	Geothermal: 0

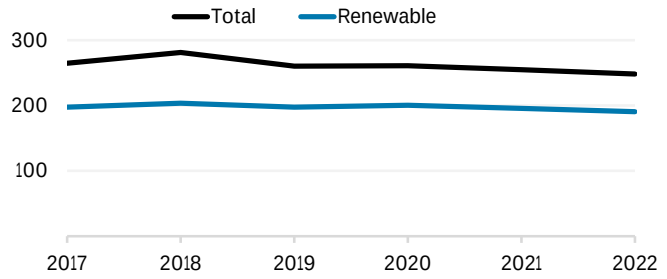
Capacity utilisation in 2022 (%)



ELECTRICITY GENERATION

Generation in 2022	GWh	%
Non-renewable	**1 593**	**23**
Renewable	**5 266**	**77**
Hydro and marine	5 230	76
Solar	36	1
Wind	0	0
Bioenergy	0	0
Geothermal	0	0
Total	**6 859**	**100**

Per capita electricity generation (kWh)



Electricity generation trend

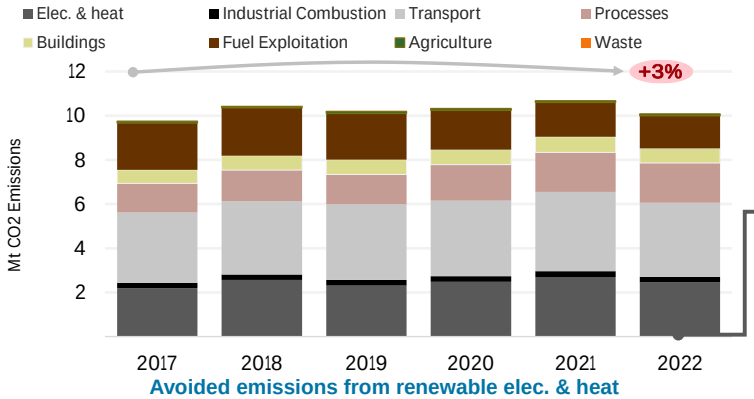
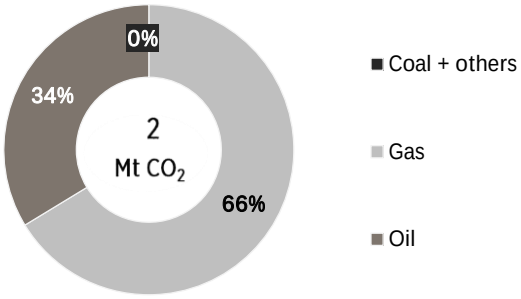
ENERGY AND EMISSIONS

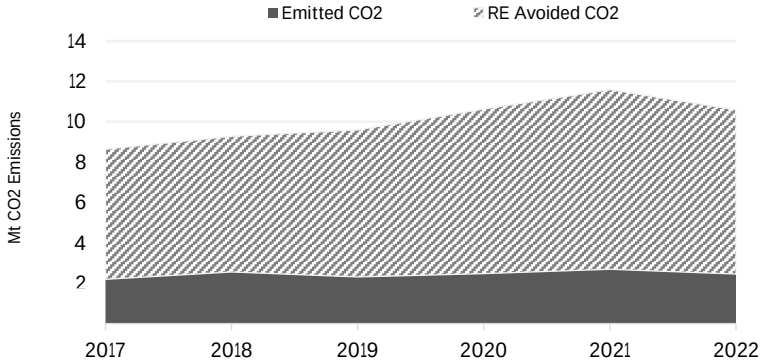
CO_2 emissions by sector



Elec. & heat generation CO_2 emissions in

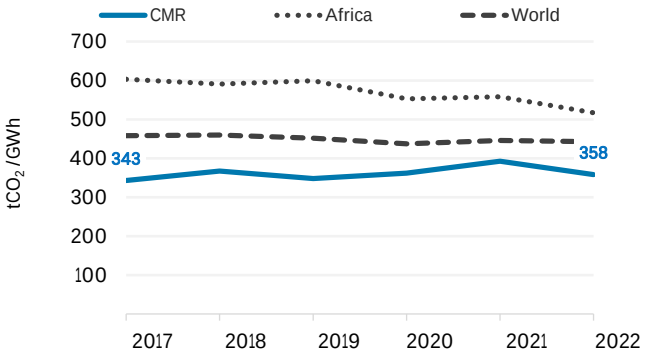


Avoided emissions from renewable elec. & heat



Avoided emissions based on fossil fuel mix used for power

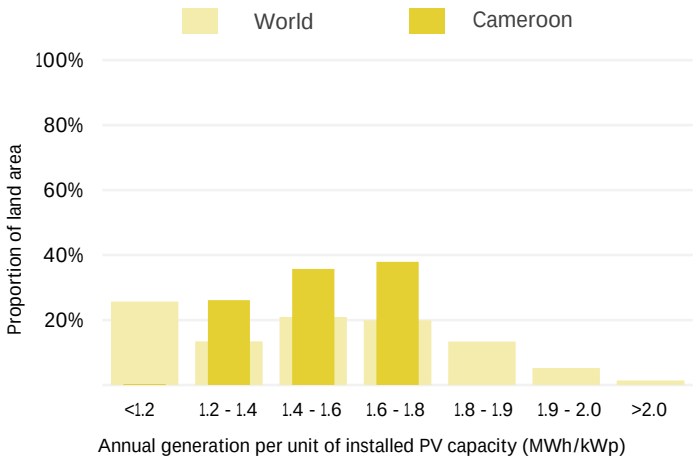
CO_2 emission factor for elec. & heat generation



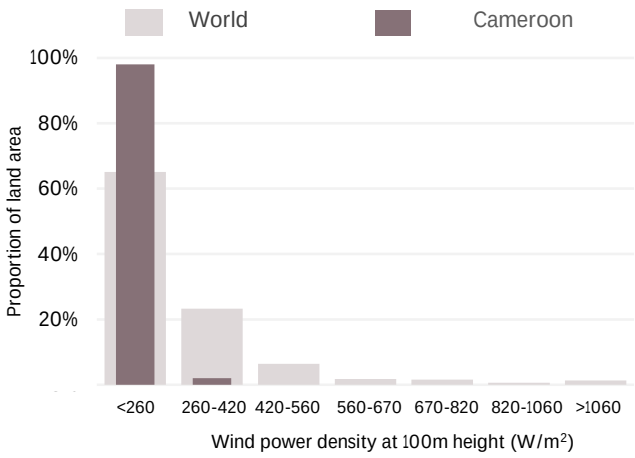
Calculated by dividing power sector emissions by elec. + heat gen.

RENEWABLE RESOURCE POTENTIAL

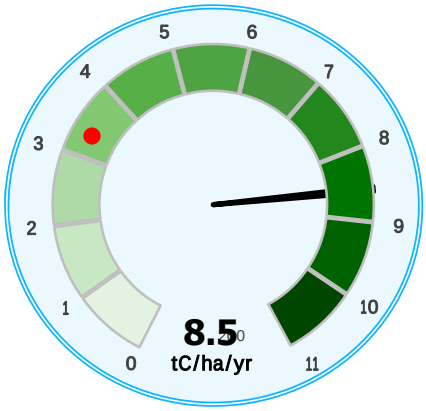
Distribution of solar potential



Distribution of wind potential



Biomass potential: net primary production



= Global average of 3-4 tC/ha/yr

Indicators of renewable resource potential

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m²) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

Sources: IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
